

Chewing and Eating:

If we used anesthetic during the procedure, we recommend that you avoid chewing until the anesthesia is completely worn off.

To protect your crown, bridge or onlay, avoid chewing ice or other hard objects.

Brushing and Flossing:

Proper technique when brushing and flossing is essential to keep the area around and under your crown, bridge or onlay free of plaque and bacteria. We may recommend special cleaning aids especially for cleaning under a bridge.

Medication and Sensitivity:

You may experience mild sensitivity; we recommend Ibuprofen or Advil for patients that do not have allergies to such medications. Otherwise you may choose a pain reliever that you would normally take.

When to call us:

It is important that your bite is correctly balanced. If you feel your bite is uneven, you have sensitivity or discomfort that increases or continues beyond four days, or if you have any questions please call our office or contact Dr. Angart on his cell phone after hours for your concerns.
